

SAFETY FIRST!

Following the release of the SAA1 beeper in 2017, we have further expanded our range of safety accessories.

The new SAA2 is the successor to the warning strobe lamp. The small, lightweight and scalable safety accessory helps you to mark your testing area and warn people that the prohibition zone around the test setup must not be entered.

Depending on the status of the test device – in operation, ready to measure, etc. – the SAA2 shows either a green or red light. In addition to the red flashlight, the SAA2 can also give an audible signal if a measurement is ongoing. It also offers an emergency button to stop the measurement immediately, if needed.

The warning lamp is equipped with magnetic holders and a hook. Thus, you can either attach it to any construction in the substation or place it on a tripod as a standalone version. The system is cascadable, so that you can decide whether you need one, two, four, or up to eight signal lamps to mark your testing area.

SAA2 can be used with CPC 100/80, TESTRANO 600, COMPANO 100, CIBANO 500 and VOTANO 100. Via the control unit, the SAA2 can be combined with other OMICRON safety accessories, such as the SAA1 beeper, TRC1 remote control, SAB1 safety box and the remote safety switch.
